Paper 1 The operation of markets and market failure

Source booklet

DO NOT WRITE ANY ANSWERS IN THIS SOURCE BOOKLET. YOU MUST ANSWER THE QUESTIONS IN THE PROVIDED ANSWER BOOKLET.

Context 1 Free school meals

Questions 21 to 26

- Extract A: Index of average household disposable income, and index of food prices, in the UK 2008 to 2012
- Extract B: The rising cost of food
- Extract C: There's no such thing as a free lunch

Context 2 Commodity prices

Questions 27 to 32

- Extract D: Average monthly world prices of potash and crude oil, January 2009 to September 2013
- Extract E: Competition in the potash market
- Extract F: Commodities markets: should governments intervene?

FREE SCHOOL MEALS

Extract A: Index of average household disposable income, and index of food prices, in the UK 2008 to 2012 (2008 = 100)

Year	Disposable income	Food prices
2008	100	100
2009	102	106
2010	105	109
2011	110	114
2012	108	118

Note: All figures are rounded

Source: Official statistics, October 2013

Extract B: The rising cost of food

In recent years, food prices have risen faster than incomes, making it harder for many low-income families to buy food which forms a significant part of their total weekly spend. On average, 11.3% of household income was spent on food in 2011, up from 10.5% in 2007. However, for the poorest 20% of households, their spending on food rose from 15.2% to 16.6% in the same period. Record numbers of people are using 'food banks', where charities provide emergency food to those struggling to feed themselves and their families. 1
5

Food prices have been rising for a number of reasons, including climate change and population growth. A spokesperson for the Food Ethics Council charity recently called for food businesses and the Government to tackle the issue of making healthy food affordable, claiming that 'cheap food', which is often an inferior good, was causing problems for health and the environment. 10

Many low-income households are already buying so-called 'value' products, so can't switch to cheaper brands. They are also less likely to buy ethical products such as free-range eggs. Between 2007 and 2011, the poorest households have cut spending on fruit by 15% and vegetables by 12%, yet their spending on sweets rose by 5%. In 2011, 62% of adults in England were either obese or overweight, whilst 1 in 20 children has no fruit or vegetables in their diet. 15

The cost of treating illnesses caused by bad diet is £6 billion per year. Considerable amounts of food are wasted each year, much of which is not used in time, bread being the most wasted food. And although much more food waste is being recycled, some still ends up in scarce landfill waste sites. These externalities cannot be ignored. 20

Extract C: There's no such thing as a free lunch

It has recently been announced that from September 2014, all infant school children in England will receive free school lunches. On average, this will save parents over £400 a year and maybe more, if it leads to them spending less on evening meals. 1

At present, free school meals are only available to those on low incomes but children do not receive them unless they are claimed. In a trial scheme, where all primary school children were given free lunches, the take-up rose from roughly 50% in both areas to 72% in one and 85% in the other. 5

Those in favour claim that children will receive 'proper food', with improvements in concentration and behaviour leading to better academic achievement and health. As well as the private benefits, there will be considerable external benefits. Some would argue that the scheme should be extended to all school children. 10

Critics argue that the £600 million a year will be subsidising children from well-off families and would be better spent on other areas or to directly support children from low-income families. And how will it be funded?

When announcing the scheme, the Deputy Prime Minister, Nick Clegg stated: "Free school meals will help give every child the chance in life they deserve, building a stronger economy and a fairer society." 15

Turn over for Context 1 questions

Context 1 - Questions 21 to 26

2 | 1

Define the term 'externalities' (**Extract B**, line 22).

[3 marks]

2 | 2

Extract B (line 2) states that spending on food by low-income families 'forms a significant part of their total weekly spend.'

Calculate the income elasticity of demand for food if an increase in income from £25 000 to £30 000 leads to an increase in the quantity demanded of food of 10%.

[4 marks]

2 | 3

Using **Extract A**, identify **two** significant points of comparison between the changes in the index of average disposable income and the changes in the index of food prices over the period shown.

[4 marks]

2 | 4

In **Extract B** (line 11) it states that a spokesperson for the Food Ethics Council charity recently claimed that 'cheap food' is often an inferior good.

Draw a supply and demand diagram showing the effects of an increase in income on the price and quantity sold of an inferior good.

[4 marks]

2 | 5

Extract B (line 1) states that 'In recent years, food prices have risen faster than incomes'.

Explain **two** possible reasons, **other than a change in income**, for the rise in the price of food over the period shown.

[10 marks]

2 | 6

Extract C (lines 15–17) states that 'Free school meals will help give every child the chance in life they deserve, building a stronger economy and a fairer society.'

Using the data in the extracts and your economic knowledge, assess whether the government should provide free school meals for all, some or no school children.

COMMODITY PRICES

Extract D: Average monthly world prices of potash and crude oil, January 2009 to September 2013

Year	Potash average monthly price, US\$ per tonne	Crude oil average monthly price, US\$ per barrel
2009	630	62
2010	330	80
2011	440	111
2012	460	112
2013	390	109

Source: Official statistics, October 2013

Notes: The 2013 figures are the average monthly prices for the nine months to September. All figures are rounded.

Extract E: Competition in the potash market

Potash is one of three main fertiliser products which farmers use to increase their output before planting crops such as wheat. Potash is an important natural resource, but for many years, the majority of the world's potash has been sold through two companies, which set the same prices. The companies effectively worked together as a monopoly. 1

However, it has recently been announced that the arrangement between these two companies has ended. As a result, the price of potash is expected to fall from around \$400 to \$300 per tonne by the end of 2013. It has been estimated that this would cut total costs by 3% an acre for many producers. This is good news for farmers and it could also lead to lower food prices in the supermarkets. 5

The fall in potash prices is in contrast to the situation in the first decade of this century, during which prices tripled, partly due to higher demand in China and India. Although this encouraged an increased supply, the higher price made the product less affordable, particularly in India, where the government had also cut farming subsidies. 10

Although prices may now fall in the short term, this may not last due to continued population growth and changing patterns in the demand for food. However, with more competition between firms, there should be some gains for buyers, at least for a while. 15

Extract F: Commodities markets: should governments intervene?

Oil is another commodity where suppliers have worked together to control prices. The Organization of the Petroleum Exporting Countries (OPEC), a group of 12 major oil-producing countries, has managed the supply of oil for over 50 years to try to control the price. 1

This has reduced fluctuations in price for both producing and consuming countries, although when producers work together, the price tends to be higher than it would be if there was more competition. 5

One effect of high oil prices is to encourage the development of other sources of energy. 'Fracking' involves obtaining gas or oil from shale rock using large quantities of water. There is considerable use of fracking in the US but there are environmental concerns, including air, water and noise pollution. Some countries have banned the technique. There are large reserves of shale gas in the UK and a firm has undertaken work to explore the possibility of fracking at a site recently. However, firms will need a licence if they are to be allowed to begin this type of work in future. 10

Commodities are vital as the raw materials and energy sources to make finished products. Should market forces be left to determine the price and output of these commodities or should governments intervene, and if so, which policies are most appropriate? Does it matter if sellers with considerable market power set the price, particularly when commodity prices may change frequently otherwise? 15

Turn over for Context 2 questions

Context 2 - Questions 27 to 32

2 | 7

Define 'monopoly' (**Extract E**, line 4).

[3 marks]

2 | 8

Extract E (line 6–7) states that 'the price of potash is expected to fall from around \$400 to \$300 per tonne by the end of 2013.'

Calculate the price elasticity of demand for potash if this fall in price leads to an increase in the quantity demanded of 10%.

[4 marks]

2 | 9

Using **Extract D**, identify **two** significant points of comparison between the changes in the price of potash and the changes in the price of crude oil over the period shown.

[4 marks]

3 | 0

Using **Extract D**, draw a bar chart to show the average monthly price of potash in the years 2009 to 2013.

[4 marks]

3 | 1

Extract E (lines 1–2), states 'Potash is one of three main fertiliser products which farmers use to increase their output before planting crops such as wheat.'

Explain the possible effects on the market for wheat of a fall in the price of a fertiliser such as potash.

[10 marks]

3 | 2

Extract F (lines 15–16) states that 'Commodities are vital as the raw materials and energy sources to make finished products.'

Using the data in the extracts and your economic knowledge, assess whether market forces should be left to determine the price of commodities such as potash, oil and gas.
